

Theory Concepts

1. What is Data Analysis?

- Data Analysis is the process of inspecting, cleaning and transforming raw data to discover useful patterns and insights. It helps business make informed decision instead of guessing.

2. How to plan a Data Science project?

- A Data Science project using the CRISP-DM Framework: Business Understanding, Data Understanding, Data Preparation, Modelling, Evaluation and Deployment. It is cyclical, iterative process.

3. How to frame a Machine Learning problem?

- Framing an ML problem means clearly defining the Input, output and Metric before building any model, so the right approach is chosen.

4. Tensor - In depth Explanation

- A tensor is a N-dimensional array of numbers used to represent data in ML/DL. Scalars (0D), vector (1D), matrices (2D), and higher-dimensional array (3D+) are all tensors.
